The County Public Works Department resurfacing spreader required continuous repair each year. Since the spreader is used only a few months of the year, the department was forced to park it outdoors in the elements the remaining several months. The spreader would rust and corrode requiring extensive repair before use the following year. Public Works sought a solution for this ongoing costly problem.

This local municipality looked to LINE-X® to coat the hopper of the spreader. The plan was to apply the LINE-X coating to the continual wear areas of the hopper thus protecting the metal substrate from rust and corrosion, saving the department a great deal of money each year.

LINE-X provided a high impact and abrasion resistant coating to the resurfacing spreader to prolong the life of the hopper. This procedure allowed the spreader to be parked outside when not in use without worry of rust and corrosion, saving the department money and downtime for repairs each year.
